SX 82303 Q
SPOT SEEDING TRIAL
PROGRESS REPORT - SPRING & FALL 1982

D. Wallinger 1982
Progress Report - Spring 1982

After a delay of some three weeks because of late snow melt, it was found that the area suggested earlier for this treat was not suitable. However, a satisfactory area was located and the trial established May 27-28th on C.P. 77 of TSHL 02044 (Crestbrook Forest Industries Ltd.)
Progress Report - Fall 1982

An examination of this trial near Cranbrook was carried out on June 23 and a second one on September 17, 1982.

Germination of the Pl seed (7 seeds sown per spot) was disappointing but could be due to the lateness of the sowing date (May 27-29) and the relatively dry condition of the site at that time. It is interesting to note that no germinants were observed on spots from which the sheltercone covers had been displaced. The attached table summarizes the results of these examinations.

The next examination of this trial is scheduled for Fall, 1983.
