Geographic Data Discovery Service

B.C. Government Corporate Metadata System for Geographic Data

This service enables you to *discover* geographic data available from the Province of B.C.

- Descriptive information (metadata), such as the name, location, access and format is available for a wide variety of the province's geographically referenced data.
- Data sources include the GeoBC Geographic Warehouse (LRDW), the Integrated Land Resource Registry (ILRR) and various operational datasets. Examples of these data include: electoral boundaries, roads, forest inventories, wildlife habitat areas, orthophotography and satellite imagery, legal interests, rights designations, and administrative boundaries.

All Fields | IAPP site | **Search**

Include Retired Data: Has Downloadable Data: **Clear**

Search Results

This page shows the results of your search. You can:

- View details** of the record by clicking on the [view detail](#) link.
- View a **printable version** of the record.

View the **XML code** of the record, downloading the metadata record(s) to an XML file. The search results default to being sorted alphabetically by title, but you can change the sorting criteria by clicking the fields at the top.

Polygon geometry for an invasive plant site. The polygon represents the area of the site. This is often defined by the extent of an invasive plant on the site (typically the dominant species) if a comprehensive inventory has been conducted or the polygon may be a site marker in the case where a comprehensive inventory is lacking. Includes attribute data for the site.

Access

- Login

***Note:** although 6 layers will show in the result set, only the invasive plant site layer is downloadable to anyone with a BCeID.
